## **REMARKS**

The examiner is correct in his analysis that the conveyor belt is turning the opposite direction in the claims from what the specification states and what the drawings show.

Claim 1 has been amended to show a counterclockwise movement of the belt, as the examiner pointed would be the correct direction of movement. The material exits a slot 60 (fig. 3) at the back of the hopper. The material exiting the slot has been added to claim 1.

The applicant believes the application is now in a condition for allowance.
